Introduction

Jcrop is a powerful image cropping engine for jQuery.

It's been designed so developers can easily integrate an advanced image cropping functionality directly into any web-based application without sacrificing power and flexibility (or the weeks of coding, testing and debugging). Jcrop also features clean, well-organized code that works well across most modern web browsers.

Here you'll find the documentation for Jcrop itself. This guide assumes that you have a basic knowledge of HTML and including files into a web page. At the end of the article, there are links to more advanced concepts and implementation techniques.

Getting Started

- Download the current version of Jcrop
- Place the files on your web server so you can request them from your page
- You also must have jQuery installed and included!

In the page `<head>` you'll need to load the requisite files. That includes:

- jQuery library
- Jcrop Javascript
- Jcrop CSS stylesheet

It should look something like this:

```
<script src="js/jquery.min.js"></script>
<script src="js/jquery.Jcrop.min.js"></script>
<link rel="stylesheet" href="css/jquery.Jcrop.css" type="text/css" />
```

Please note: These are only example paths, you probably *will* need to adjust them when you actually use them, to match the location of the files on your server. Jcrop *will* not function properly if you don't.

Invocation

Let's suppose we have this image our markup:

```

```

To convert this into a Jcrop widget, insert the following script:

```
<script language="Javascript">
  jQuery(function($) {
    $('#target').Jcrop();
  });
</script>
```

Jcrop's default behavior is activated. Since there are no event handlers attached, it won't do anything cool, but you can see how easy it is to implement Jcrop into your page.

See the Jcrop "hello world" example

Event Handlers

Jcrop's two primary event handlers are *onChange* and *onSelect*.

onSelect	<i>callback</i>	Called when selection is completed
onChange	<i>callback</i>	Called when the selection is moving

Jcrop has a sense of state, whether there is an active selection or not. To detect when the interface is released, there is also a handler for these events:

onRelease	<i>callback</i>	Called when the selection is released
------------------	-----------------	---------------------------------------

Define an event handler function:

```
<script language="Javascript">

  function showCoords(c)
  {
    // variables can be accessed here as
    // c.x, c.y, c.x2, c.y2, c.w, c.h
  };

</script>
```

Attach event handlers like this:

```
<script language="Javascript">

  jQuery(function($) {
    $('#target').Jcrop({
      onSelect: showCoords,
      onChange: showCoords
    });
  });

</script>
```

This is a conventional jQuery syntax. Note that the last property does not have a comma following (also applies if there is only one property specified). Also be sure to leave off parenthesis on callback functions (you're referring to the named function, not calling it).

See the simple event handler demo

Setting Options

Jcrop options allow you to alter appearance and behavior.

Option Name	Value Type	Description	Default
aspectRatio	<i>decimal</i>	Aspect ratio of w/h (e.g. 1 for square)	<i>n/a</i>
minSize	<i>array [w, h]</i>	Minimum width/height, use 0 for unbounded dimension	<i>n/a</i>
maxSize	<i>array [w, h]</i>	Maximum width/height, use 0 for unbounded	<i>n/a</i>

		dimension	
setSelect	<i>array [x, y, x2, y2]</i>	Set an initial selection area	<i>n/a</i>
bgColor	<i>color value</i>	Set color of background container	'black'
bgOpacity	<i>decimal 0 - 1</i>	Opacity of outer image when cropping	.6

Set these options in the same way as event handlers.

Here's an example:

```
<script language="Javascript">

    jQuery(function($) {
        $('#target').Jcrop({
            onSelect:    showCoords,
            bgColor:     'black',
            bgOpacity:   .4,
            setSelect:    [ 100, 100, 50, 50 ],
            aspectRatio: 16 / 9
        });
    });

</script>
```

Note a few things about the format of the options object:

- Text values must be quoted (e.g. 'red', '#ccc', 'rgb(10,10,10)')
- Numeric values, including decimals, should not be quoted.
- *setSelect* takes an array, here indicated as an array literal
- *aspectRatio* may be easiest to set by dividing width/height
- The last option is not followed by a comma
